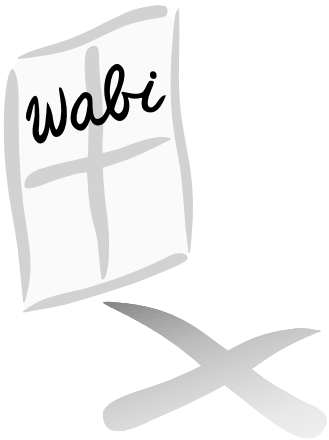
Wabi

Wabi™ allows Microsoft® Windows applications to run "off-the-shelf" on UNIX® systems with all the functionality and performance users expect. With Wabi, end-users have the power and flexibility of UNIX without sacrificing investments in PC applications and training.

Give Your PC and UNIX Users The Best of Both Worlds.



SunSelect's Wabi software is the first technology that allows Windows applications to run at native performance levels directly on UNIX desktops. An industry breakthrough, the product will be licensed to leading UNIX vendors. Wabi, together with UNIX, offers the ultimate operating environment for the desktop, by combining the power and maturity of UNIX with the ability to run off-the-shelf Windows personal productivity applications directly on UNIX-based PC's and workstations.

Wabi improves the value of Windows applications by allowing them to take advantage of UNIX performance and features. Users can run multiple, simultaneous Windows applications with Wabi, taking advantage of UNIX multitasking capabilities. With Wabi, UNIX network resources, such as files and printers, are available from within Microsoft Windows applications. Wabi also offers multi-user support via X-terminals.

Wabi requires minimal extra investment, unlike other solutions which run PC applications on UNIX. Wabi translates the MS-Windows calls to X Windows calls, the industry standard for displaying graphical elements on networked computers. Wabi runs Windows applications on both X86 and RISC-based UNIX systems.

Wabi is the new standard for running Windows applications on UNIX. Offered by the leading UNIX vendors and endorsed by major Windows application developers, Wabi offers something new — freedom to choose. Freedom to choose the best platform for mission critical, client/server and network applications. And, freedom to choose from widely available, personal productivity applications. Wabi, the best of both worlds.
