People are very good at recognizing shapes
  \- Intrinsically difficult, computers are bad at it

Why is it difficult?
Why is it a Problem?

- Difficult scene conditions

[From: Grauman & Leibe]
Why is it a Problem?

- Huge within-class variations. Recognition is mainly about modeling variation.

[Pic from: S. Lazebnik]
Why is it a Problem?

- Tones of classes

[Biederman]
People are very good at recognizing shapes
  - Intrinsically difficult, computers are bad at it

Some reasons why it is difficult:
People are very good at recognizing shapes
  - Intrinsically difficult, computers are bad at it

Some reasons why it is difficult:
  - **Segmentation**: Real scenes are cluttered
People are very good at recognizing shapes
  
  - Intrinsically difficult, computers are bad at it

Some reasons why it is difficult:
  
  - **Segmentation**: Real scenes are cluttered
  - **Invariances**: We are very good at ignoring all sorts of variations that do not affect shape
People are very good at recognizing shapes
  
  - Intrinsically difficult, computers are bad at it

Some reasons why it is difficult:
  
  - **Segmentation**: Real scenes are cluttered
  - **Invariances**: We are very good at ignoring all sorts of variations that do not affect shape
  - **Deformations**: Natural shape classes allow variations (faces, letters, chairs)

- A huge amount of *computation* is required
How can we apply neural nets to images?

What can we do?

We can use a locally connected layer.
How can we apply neural nets to images?

Images can have millions of pixels, i.e., $x$ is very high dimensional.
How to Deal with Large Input Spaces

- How can we apply neural nets to images?
- Images can have millions of pixels, i.e., \( x \) is very high dimensional
- How many parameters do I have?
How to Deal with Large Input Spaces

- How can we apply neural nets to images?
- Images can have millions of pixels, i.e., $x$ is very high dimensional
- How many parameters do I have?
- Prohibitive to have fully-connected layers
How can we apply neural nets to images?

Images can have millions of pixels, i.e., $x$ is very high dimensional

How many parameters do I have?

Prohibitive to have fully-connected layers

What can we do?
How to Deal with Large Input Spaces

- How can we apply neural nets to images?
- Images can have millions of pixels, i.e., $x$ is very high dimensional
- How many parameters do I have?
- Prohibitive to have fully-connected layers
- What can we do?
- We can use a locally connected layer
Locally Connected Layer

Example: 200x200 image
40K hidden units
Filter size: 10x10
4M parameters

Note: This parameterization is good when input image is registered (e.g., face recognition).
When Will this Work?

This is good when the input is (roughly) registered
When Will this Work?

- This is good when the input is (roughly) registered
The object can be anywhere
The object can be anywhere
The object can be anywhere
Locally Connected Layer

STATIONARITY? Statistics is similar at different locations

Example: 200x200 image
40K hidden units
Filter size: 10x10
4M parameters

Note: This parameterization is good when input image is registered (e.g., face recognition).

Ranzato
The replicated feature approach

- Adopt approach apparently used in monkey visual systems
- Use many different copies of the same feature detector.
  - Copies have slightly different positions.
  - Could also replicate across scale and orientation.
    - Tricky and expensive
  - Replication reduces number of free parameters to be learned.
- Use several different feature types, each with its own replicated pool of detectors.
  - Allows each patch of image to be represented in several ways.

The red connections all have the same weight.
Convolutional Neural Net

- Idea: statistics are similar at different locations (Lecun 1998)
- Connect each hidden unit to a small input patch and share the weight across space
- This is called a convolution layer and the network is a convolutional network
Convolutional Layer

\[ h_j^n = \max(0, \sum_{k=1}^{K} h_{k}^{n-1} \ast w_{jk}^n) \]
Convolutional Layer

\[ h_j^n = \max(0, \sum_{k=1}^{K} h_k^{n-1} \ast w_{jk}^n) \]
Convolutional Layer

\[ h_j^n = \max(0, \sum_{k=1}^{K} h_{k}^{n-1} \ast w_{jk}^n) \]
Convolutional Layer

\[ h_j^n = \max(0, \sum_{k=1}^{K} h_{j}^{n-1} \ast w_{jk}^n) \]
Convolutional Layer

\[ h_j^n = \max(0, \sum_{k=1}^{K} h_{k}^{n-1} \ast w_{jk}^n) \]
Convolutional Layer

\[ h_j^n = \max(0, \sum_{k=1}^{K} h_{k}^{n-1} \ast w_{jk}^n) \]
Learn multiple filters.

E.g.: 200x200 image
100 Filters
Filter size: 10x10
10K parameters
Convolutional Layer

[http://cs231n.github.io/convolutional-networks/]
By “pooling” (e.g., taking max) filter responses at different locations we gain robustness to the exact spatial location of features.
Pooling Options

- **Max Pooling**: return the maximal argument
- **Average Pooling**: return the average of the arguments
- Other types of pooling exist.
Figure: **Left:** Pooling, **right:** max pooling example
Pooling

Figure: Left: Pooling, right: max pooling example

Hyperparameters of a pooling layer:

- The stride

[http://cs231n.github.io/convolutional-networks/]
Pooling Layer: Receptive Field Size

If convolutional filters have size $K \times K$ and stride 1, and pooling layer has pools of size $P \times P$, then each unit in the pooling layer depends upon a patch (at the input of the preceding conv. layer) of size: $(P+K-1) \times (P+K-1)$
It is easy to modify the backpropagation algorithm to incorporate linear constraints between the weights.

To constrain: \[ w_1 = w_2 \]

we need: \[ \Delta w_1 = \Delta w_2 \]
It is easy to modify the backpropagation algorithm to incorporate linear constraints between the weights.

To constrain: \( w_1 = w_2 \)

we need: \( \Delta w_1 = \Delta w_2 \)

We compute the gradients as usual, and then modify the gradients so that they satisfy the constraints.

compute: \( \frac{\partial E}{\partial w_1} \) and \( \frac{\partial E}{\partial w_2} \)

use: \( \frac{\partial E}{\partial w_1} + \frac{\partial E}{\partial w_2} \) for \( w_1 \) and \( w_2 \)
It is easy to modify the backpropagation algorithm to incorporate linear constraints between the weights.

To constrain: \( w_1 = w_2 \)

we need: \( \Delta w_1 = \Delta w_2 \)

We compute the gradients as usual, and then modify the gradients so that they satisfy the constraints.

compute: \( \frac{\partial E}{\partial w_1} \) and \( \frac{\partial E}{\partial w_2} \)

use: \( \frac{\partial E}{\partial w_1} + \frac{\partial E}{\partial w_2} \) for \( w_1 \) and \( w_2 \)

So if the weights started off satisfying the constraints, they will continue to satisfy them.
Backpropagation with Weight Constraints

- It is easy to modify the backpropagation algorithm to incorporate linear constraints between the weights.

  To constrain: \( w_1 = w_2 \)

  we need: \( \Delta w_1 = \Delta w_2 \)

- We compute the gradients as usual, and then modify the gradients so that they satisfy the constraints.

  compute: \( \frac{\partial E}{\partial w_1} \) and \( \frac{\partial E}{\partial w_2} \)

  use: \( \frac{\partial E}{\partial w_1} + \frac{\partial E}{\partial w_2} \) for \( w_1 \) and \( w_2 \)

- So if the weights started off satisfying the constraints, they will continue to satisfy them.

- This is an intuition behind the backprop. In practice, write down the equations and compute derivatives (it's a nice exercise, do it at home)
Now let’s make this very deep to get a real state-of-the-art object recognition system
Remember from your image processing / computer vision course about filtering?
Convolutional Neural Networks (CNN)

- If our filter is $[-1, 1]$, you get a vertical edge detector.
Now imagine we want to have many filters (e.g., vertical, horizontal, corners, one for dots). We will use a filterbank.
Convolutional Neural Networks (CNN)

- So applying a filterbank to an image yields a cube-like output, a 3D matrix in which each slice is an output of convolution with one filter. We apply an activation function on each hidden unit (typically a ReLU).
Convolutional Neural Networks (CNN)

- So applying a filterbank to an image yields a cube-like output, a 3D matrix in which each slice is an output of convolution with one filter. We apply an activation function on each hidden unit (typically a ReLU).
Do some additional tricks. A popular one is called **max pooling**. Any idea why you would do this?

\[
O(i, j) = \max_{k \in \{i-1, i, i+1\}, l \in \{j-1, j, j+1\}} O(k, l)
\]

Take each slice in the output cube, and in each pixel compute a max over a small patch around it. This is called **max pooling**.
Convolutional Neural Networks (CNN)

- Do some additional tricks. A popular one is called max pooling. Any idea why you would do this? To get invariance to small shifts in position.

\[
O(i, j) = \max_{k \in \{i-1, i, i+1\}} \max_{l \in \{j-1, j, j+1\}} O(k, l)
\]

Take each slice in the output cube, and in each pixel compute a max over a small patch around it. This is called max pooling.
Convolutional Neural Networks (CNN)

- Now add another “layer” of filters. For each filter again do convolution, but this time with the output cube of the previous layer.
Convolutional Neural Networks (CNN)

- Keep adding a few layers. Any idea what’s the purpose of more layers? Why can’t we just have a full bunch of filters in one layer?

Do it recursively
Have multiple "layers"
In the end add one or two **fully** (or **densely**) connected layers. In this layer, we don’t do convolution we just do a dot-product between the “filter” and the output of the previous layer.
Add one final layer: a **classification** layer. Each dimension of this vector tells us the probability of the input image being of a certain class.
The trick is to not hand-fix the weights, but to \textit{train} them. Train them such that when the network sees a picture of a dog, the last layer will say “dog”.

![Diagram of Convolutional Neural Networks (CNN)]
Convolutional Neural Networks (CNN)

- Or when the network sees a picture of a cat, the last layer will say “cat”.
Convolutional Neural Networks (CNN)

- Or when the network sees a picture of a boat, the last layer will say “boat”... The more pictures the network sees, the better.

Train on **lots** of examples. Millions. Tens of millions. Wait a week for training to finish.

Share your network (the weights) with others who are not fortunate enough with GPU power.
Once trained we feed in an image or a crop, run through the network, and read out the class with the highest probability in the last (classif) layer.
Architecture for Classification

Total nr. params: 60M
- 4M: LINEAR
- 16M: FULLY CONNECTED
- 37M: FULLY CONNECTED
- 442K: MAX POOLING
- 1.3M: CONV
- 884K: CONV
- 307K: MAX POOLING
- 35K: LOCAL CONTRAST NORM

(Classification)

(Detection)
So networks turn out to be great.

Everything is deep, even if it’s shallow!

Companies leading the competitions as they have more computational power

At this point Google, Facebook, Microsoft, Baidu “steal” most neural network professors/students from academia
So Neural Networks are Great

- But to train the networks you need quite a bit of computational power (e.g., GPU farm). So what do you do?
So Neural Networks are Great

- Buy even more.
So Neural Networks are Great

- And train **more layers**. 16 instead of 7 before. 144 million parameters.

**Figure:** K. Simonyan, A. Zisserman, Very Deep Convolutional Networks for Large-Scale Image Recognition. arXiv 2014
150 Layers!

- Networks are now at 150 layers
- They use a skip connections with special form
- In fact, they don’t fit on this screen
- Amazing performance!
- A lot of “mistakes” are due to wrong ground-truth

What do CNNs Learn?

How to Train Good CNNs

- Normalize your data (standard trick: subtract mean, divide by standard deviation)

Augment your data (add image flips, rotations, etc)

Keep training data balanced

Shu✏

In training: Random initialization of weights with proper variance

Monitor your loss function, and accuracy (performance) on validation

If your labeled image dataset is small: pre-train your CNN on a large dataset (eg Imagenet), and fine-tune on your dataset
