

# CSCI 6114 Fall 2023: Problem Set on P/poly

Joshua A. Grochow

August 31, 2023

## Read before class:

- Arora & Barak §6.1 (in the freely available draft version is fine,  $\sim 6$  pages)
- Homer & Selman §8.1, up to but excluding Theorem 8.3 ( $\sim 9$  pages).

## Additional resources:

- Sipser §9.3
- Du & Ko §6.2
- Hemaspaandra & Ogihara *Complexity Theory Companion* p. 276
- Wigderson §5.2.1.
- Moore & Mertens §6.5

## To work on during class:

A *circuit family* is a sequence  $C = (C_1, C_2, C_3, \dots)$  of Boolean circuits  $C_i$  where  $C_i$  takes  $i$  inputs. The language decided by a circuit family  $C$  is  $L(C) = \{x : C_{|x|}(x) = 1\}$ . P/poly is the class of languages that can be decided by a circuit family of polynomial size, that is, where  $|C_n| \leq \text{poly}(n)$ .

1. Show that  $P \subseteq P/\text{poly}$ .
2. Show that there are uncomputable languages in P/poly. Conclude that  $P \neq P/\text{poly}$ .

3. Definition: A circuit family  $C$  is P-uniform if there is a polynomial-time Turing machine that, on input  $1^n$ , outputs a description of the circuit  $C_n$ .

Show that P-uniform P/poly is equal to P.

4. Given a class  $\mathcal{C}$  of languages and a function  $f: \mathbb{N} \rightarrow \mathbb{N}$ , we define “ $\mathcal{C}$  with  $f$ -bounded advice”, denoted  $\mathcal{C}/f$ , as the class of languages  $L$  such that there exists  $L' \in \mathcal{C}$  and there exist strings  $a_1, a_2, a_3, \dots$  (“a” for “advice”) with  $|a_n| \leq f(n)$  such that for all  $x$ ,

$$x \in L \iff (x, a_{|x|}) \in L'.$$

In other words, there is a single advice string  $a_n$  that helps  $L'$  decide membership in  $L$  for *all* strings  $x$  of length  $n$ .

Prove that P/poly (defined in terms of circuits as above) is equal to the union of advice classes  $\bigcup_k P/O(n^k)$ . (Hence the notation “P/poly”.)

5. A language  $L$  is (*polynomially*) *sparse* if there is a polynomial  $p$  such that the number of strings in  $L$  of length  $\leq n$  is at most  $p(n)$ .

(a) Show that all sparse languages are in P/poly.

(b) Show that  $P/poly = P^{SPARSE}$ , that is, P/poly is the class of languages  $L$  such that there is some sparse language  $S$  and  $L$  reduces to  $S$  by a polynomial-time oracle Turing machine (denoted  $L \leq_T^P S$ ).

6. Show that  $P \neq P/O(\log n)$ , by showing that the latter has uncomputable languages.

7. (a) Show that search reduces to decision for SAT: there is a function in  $FP^{NP}$  that, given a Boolean formula  $\varphi$ , either outputs a satisfying assignment to  $\varphi$  (if one exists), or correctly reports that no satisfying assignments exist.

(b) Despite Question 6, show that  $NP \subseteq P$  iff  $NP \subseteq P/O(\log n)$ .

(c) What can you say if  $NP \subseteq P/poly$ ?

8. It is natural to wonder whether uncomputable languages are the only thing standing in the way of P being equal to P/poly. Here, show that’s not the case, i.e., that  $P/poly \cap COMP \neq P$ , i.e., that there are computable languages in P/poly that aren’t in P. *Hint*: Pick a hard but computable language, far outside of P, and encode it in unary.

You may assume the Time Hierarchy Theorem: if  $T(n) \log T(n) < o(T'(n))$ , then  $\text{DTIME}(T(n)) \subsetneq \text{DTIME}(T'(n))$ . How large must  $T'$  be to get this to work against P?
