CSC 363 - Test \#2 - 2010-03-17

1) [ 30 marks ] Recall that a clique in an undirected graph is a set of nodes in which every pair of nodes is connected by an edge. The textbook defined the language CLIQUE as follows:

CLIQUE $=\{\langle G, k\rangle \mid G$ is an undirected graph that contains a clique with $k$ nodes $\}$
The textbook proves that CLIQUE is NP-complete. Define the language TWO-CLIQUES as:
TWO-CLIQUES $=\{\langle G, k\rangle \mid G$ is an undirected graph that contains two disjoint cliques of size $k\}$
Prove that TWO-CLIQUES is NP-complete. Remember: You need to show two things to show that a language is NP-complete.
2) [ 45 marks total ] Part of the proof in the textbook that SAT is NP-complete shows that for any language, $A$, in NP, which is decided by a nondeterministic Turing Machine, $N$, that runs in polynomial time, there is a function that maps a string $w$ to a string $\langle\phi\rangle$ that is an encoding of a Boolean formula, $\phi$, that is satisfiable iff $N$ accepts $w$.
The proof shows that there is an algorithm to do this reduction in polynomial time, for some fixed nondeterministic Turing Machine, $N$, which runs in some polynomial time bound - say $n^{k}+2$, for some $k$, where $n$ is the length of the input. The algorithm takes the string $w$ as input and outputs $\langle\phi\rangle$. The formula $\phi$ that it creates has variables that describe the "tableau" for a computation of $N$ on input $w$ that halts within $n^{k}+2$ steps (we'll let this tableau be $n^{k}+3$ by $n^{k}+5$ in size). The rows of the tableau are successive configurations of $N$, bounded by "\#" symbols. The variable $x_{i, j, s}$ is 1 iff cell $(i, j)$ of the tableau contains symbol $s$, where $s \in Q \cup \Gamma \cup\{\#\}$.
Recall that the formula $\phi$ has the form

$$
\phi=\phi_{\text {cell }} \wedge \phi_{\text {start }} \wedge \phi_{\text {move }} \wedge \phi_{\text {accept }}
$$

where $\phi_{\text {cell }}$ enforces that the variables describe a tableau with exactly one symbol in each cell, $\phi_{\text {start }}$ enforces that the first configuration is the correct start configuration for input $w, \phi_{\text {move }}$ enforces that each configure is followed by a possible successor configuration (same as the previous one if the machine has halted), and $\phi_{\text {accept }}$ enforces that the tableau contains an accepting configuration.
Suppose that the input alphabet of machine $N$ is $\Sigma=\{0,1\}$, the tape alphabet is $\Gamma=\{0,1$, blank $\}$, the state space is $Q=\left\{q_{0}, q_{1}, q_{\text {accept }}, q_{\text {reject }}\right\}$, the start state is $q_{0}$, and the transition function, $\delta: Q \times \Gamma \rightarrow Q \times \Gamma \times\{L, R\}$, is as follows:

$$
\begin{gathered}
\delta\left(q_{0}, 0\right)=\left\{\left(q_{1}, 1, L\right),\left(q_{1}, 0, R\right)\right\}, \quad \delta\left(q_{0}, 1\right)=\left\{\left(q_{1}, 1, L\right)\right\}, \quad \delta\left(q_{0}, \text { blank }\right)=\left\{\left(q_{\text {reject }}, \text { blank, } L\right)\right\} \\
\delta\left(q_{1}, 1\right)=\left\{\left(q_{1}, 1, R\right)\right\}, \quad \delta\left(q_{1}, 0\right)=\left\{\left(q_{\text {reject }}, 0, R\right)\right\}, \quad \delta\left(q_{1}, \text { blank }\right)=\left\{\left(q_{\text {accept }}, \text { blank, } L\right)\right\}
\end{gathered}
$$

For all the questions below, suppose that the input is $w=011$, so that $n=3$, and that $k=1$, so the tableau has 6 rows and 8 columns.
a) [ 12 marks ] Fill in the two tableaus below to represent two different accepting computations on this input.

|  |  |  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |

|  |  |  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |

b) [ 5 marks ] How many variables are there in the formula $\phi$ ? Explain.
b) [ 9 marks ] Write down the $\phi_{\text {start }}$ part of $\phi$ for this input.
c) [ 9 marks ] The $\phi$ accept part of $\phi$ is a disjunction (or) of literals. Write down three of these literals, and say (and explain) how many literals are in this disjunction.
d) [ 10 marks, +1 for each correct, -1 for each wrong, minimum 0 ] The $\phi_{\text {move part of } \phi \text { ensures }}$ that every $2 \times 3$ "window" of the tableau is legal for the machine $N$. For each of the following windows, circle "Yes" or "No" to indicate whether it is legal or not (no explanation is required):

| $\#$ | 0 | 1 |
| :---: | :---: | :---: |
| $\#$ | 0 | 1 | Legal? Yes No

| 1 | 1 | $q_{1}$ |
| :---: | :---: | :---: |
| 1 | 1 | 1 |

Legal? Yes No

| $q_{0}$ | 1 | 1 |
| :--- | :--- | :--- |
| $q_{0}$ | 1 | 1 |

Legal? Yes No

| 0 | 0 | 1 |
| :--- | :--- | :--- |
| 0 | 1 | 1 |

Legal? Yes No

| $q_{1}$ | 0 | 1 |
| :---: | :---: | :---: |
| 1 | 0 | 1 |

Legal? Yes No

| $\#$ | $q_{0}$ | 1 |
| :--- | :--- | :--- |
| $\#$ | $q_{0}$ | 0 |

Legal? Yes No

| $q_{0}$ | 0 | 1 |
| :---: | :---: | :---: |
| 1 | $q_{0}$ | 1 |

Legal? Yes No

| $q_{1}$ | 1 | 1 |
| :---: | :---: | :---: |
| 1 | $q_{1}$ | 1 | Legal? Yes No

| 1 | $q_{1}$ | blank |
| :---: | :---: | :---: |
| $q_{\text {accept }}$ | 1 | blank |

Legal? Yes No

| $\#$ | $q_{0}$ | blank |
| :---: | :---: | :---: |
| $\#$ | $q_{0}$ | blank |

Legal? Yes No
3) [ 25 marks ] The class coNP is defined to contain all languages whose complements are in NP - in other words, $L \in$ coNP iff $\bar{L} \in \mathrm{NP}$. A language $L$ is defined to be coNP-complete if $L$ is in coNP and any other language in coNP is polynomial time reducible to $L$ - in other words, $L$ is coNP-complete iff $L \in \mathrm{coNP}$ and for all $L^{\prime} \in \mathrm{coNP}, L^{\prime} \leq_{P} L$.
Prove that $\overline{\mathrm{SAT}}$ is coNP-complete. You may use any parts of the proof that SAT is NP-complete that are useful for proving this.
