# Managing Requirements Change

### → Managers need to respond to requirements change

- & Add new requirements during development
- > But not succumbing to feature creep
- & Modify requirements during development
  - > Because development is a learning process
- Semove requirements during development
  - > requirements "scrub" for handling cost/schedule slippage

### → Key techniques

- **& Change Management Process**
- ⋄ Release Planning
- ♥ Requirements Prioritization (previous lecture!)
- **♦ Requirements Traceability**
- Stability (next week's lecture)

## Towards Software Families

### → Libraries of Reusable Components

- by domain specific libraries (e.g. Math libraries)
- ♥ program development libraries (e.g. Java AWT, C libraries)

### → Domain Engineering

- ♥ Divides software development into two parts:
  - > domain analysis identifies generic reusable components for a problem domain
  - > application development uses the domain components for specific applications.

#### → Software Families

- & Many companies offer a range of related software systems
  - > Choose a stable architecture for the software family
  - > identify variations for different members of the family
- Represents a strategic business decision about what software to develop
- ♥ Vertical families
  - > e.g. 'basic', 'deluxe' and 'pro' versions of a system
- ♦ Horizontal families
  - > similar systems used in related domains

## Change Management

### → Configuration Management

- ⋄ Each distinct product is a Configuration Item (CI)
- Seach configuration item is placed under version control
- ♥ Control which version of each CI belongs in which build of the system

#### → Baselines

- & A baseline is a stable version of a document or system
  - > Safe to share among the team
- & Formal approval process for changes to be incorporated into the next

### → Change Management Process

- & All proposed changes are submitted formally as change requests
- A review board reviews these periodically and decides which to accept
  - > Review board also considers interaction between change requests

# Requirements Traceability

### → From IEEE-STD-830:

- Backward traceability
  - > i.e. to previous stages of development.
  - > the origin of each requirement should be clear

#### ♥ Forward traceability

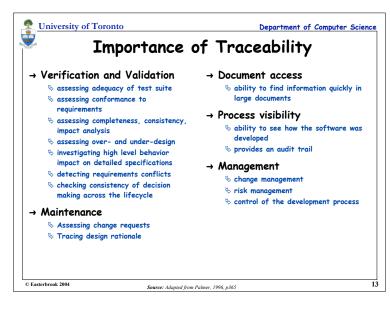

- > i.e., to all documents spawned by the SRS.
- > Facilitation of referencing of each requirement in future documentation
- > depends upon each requirement having a unique name or reference number.

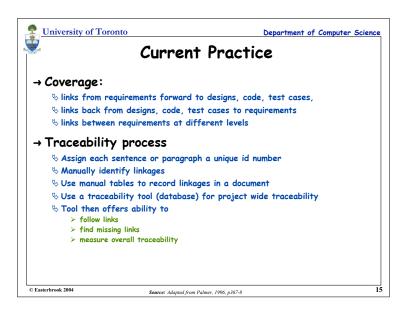

#### → From DOD-STD-2167A:

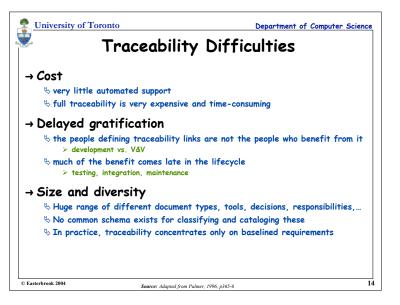

- A requirements specification is traceable if:
  - $\succ$  "(1) it contains or implements all applicable stipulations in predecessor document
  - $\succ$  (2) a given term, acronym, or abbreviation means the same thing in all documents
  - > (3) a given item or concept is referred to by the same name in the documents
  - > (4) all material in the successor document has its basis in the predecessor document, that is, no untraceable material has been introduced
  - > (5) the two documents do not contradict one another"

## **Problematic Questions**

### → Involvement

Who has been involved in the production of this requirement and how?

### → Responsibility & Remit

- ♦ Who is responsible for this requirement?
  - > who is currently responsible for it?
  - > at what points in its life has this responsibility changed hands?
- Within which group's remit are decisions about this requirement?

### → Change

At what points in the life of this requirements has working arrangements of all involved been changed?

### → Notification

### → Loss of knowledge

What are the ramifications regarding the loss of project knowledge if a specific individual or group leaves?
