

# Lecture 19: Verification and Validation

## → Some Refreshers:

- ↪ Summary of Modelling Techniques seen so far
- ↪ Recap on definitions for V&V

## → Validation Techniques

- ↪ Inspection (see lecture 6)
- ↪ Model Checking (see lecture 16)
- ↪ Prototyping

## → Verification Techniques

- ↪ Consistency Checking
- ↪ Making Specifications Traceable (see lecture 21)

## → Independent V&V

# We've seen the following UML diagrams:

## ↪ Activity diagrams

- capture business processes involving **concurrency and synchronization**
- good for analyzing **dependencies between tasks**

## ↪ Class Diagrams

- capture the **structure of the information** used by the stakeholders
- good for analysing the **relationships** between data items
- also help to identify a **modular structure** for the system

## ↪ Statecharts

- capture all possible **responses** of an system (or object) to **events**
- good for modeling the **dynamic behavior** of a class of objects
- good for analyzing **event ordering, reachability, deadlock, etc.**

## ↪ Use Cases

- capture the **user's view** of the system and its main **functions**
- good starting point for **specification** of functionality
- good visual overview of the main functional requirements

## ↪ Sequence Diagrams (collaboration diagrams are similar)

- capture an individual **scenario** (one path through a use case)
- good for modelling **interactions** between users and system objects
- good for identifying which objects (classes) participate in each use case
- helps you check that you identified all the necessary classes and operations

# ...and the following non-UML diagrams:

## ↪ Goal Models

- Capture **strategic goals** of stakeholders
- Good for exploring 'how' and 'why' questions with stakeholders
- Good for analysing **trade-offs**, especially over design choices

## ↪ Fault Tree Models (as an example risk analysis technique)

- Capture **potential failures** of a system and their **root causes**
- Good for analysing **risk**, especially in safety-critical applications

## ↪ Strategic Dependency Models (i\*)

- Capture **relationships between actors** in an organisational setting
- Helps to relate **stakeholders's goals** to their **organisational setting**
- Good for understanding how the organisation will be changed

## ↪ Entity-Relationship Models

- Capture the relational **structure of information** to be stored
- Good for understanding **constraints and assumptions** about the subject domain
- Good basis for database design

## ↪ Mode Class Tables, Event Tables and Condition Tables (SCR)

- Capture the **dynamic behaviour** of a real-time reactive system
- Good for representing **functional mapping of inputs to outputs**
- Good for making behavioural models precise, for **automated reasoning**

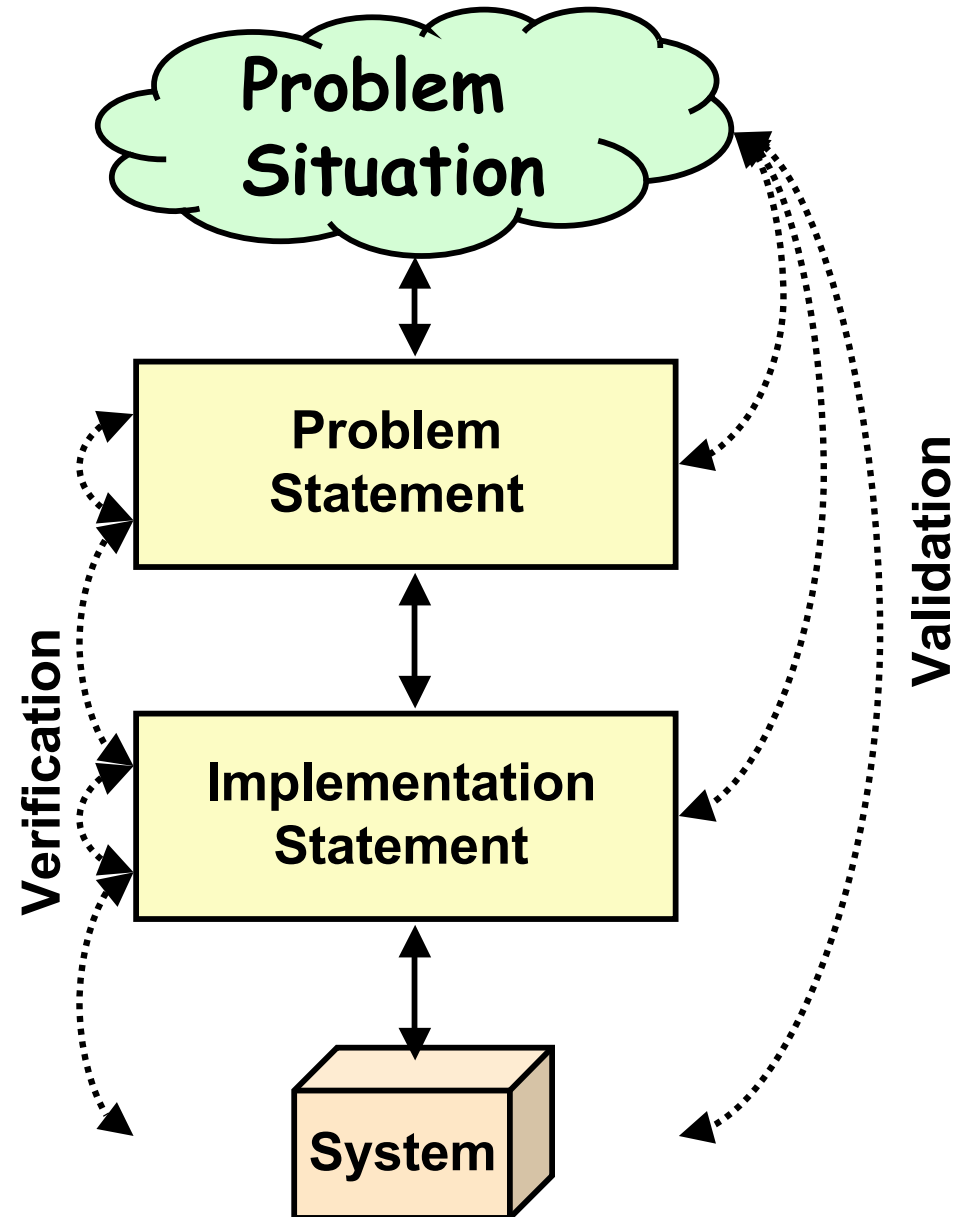

# Verification and Validation

## → Validation:

- ↪ "Are we building the right system?"
- ↪ Does our problem statement accurately capture the real problem?
- ↪ Did we account for the needs of all the stakeholders?

## → Verification:

- ↪ "Are we building the system right?"
- ↪ Does our design meet the spec?
- ↪ Does our implementation meet the spec?
- ↪ Does the delivered system do what we said it would do?
- ↪ Are our requirements models consistent with one another?

# Refresher: V&V Criteria

Source: Adapted from Jackson, 1995, p170-171

Application Domain

Machine Domain

D - domain properties  
R - requirements

S - specification

C - computer  
P - program

## → Some distinctions:

- ↪ **Domain Properties:** things in the application domain that are true anyway
- ↪ **Requirements:** things in the application domain that we wish to be made true
- ↪ **Specification:** a description of the behaviours the program must have in order to meet the requirements

## → Two verification criteria:

- ↪ **The Program** running on a particular **Computer** satisfies the **Specification**
- ↪ **The Specification**, given the **Domain properties**, satisfies the **Requirements**

## → Two validation criteria:

- ↪ **Did we discover (and understand) all the important Requirements?**
- ↪ **Did we discover (and understand) all the relevant Domain properties?**

# V&V Example

## → Example:

### ↪ Requirement R:

- "Reverse thrust shall only be enabled when the aircraft is moving on the runway"

### ↪ Domain Properties D:

- Wheel pulses on if and only if wheels turning
- Wheels turning if and only if moving on runway

### ↪ Specification S:

- Reverse thrust enabled if and only if wheel pulses on

## → Verification

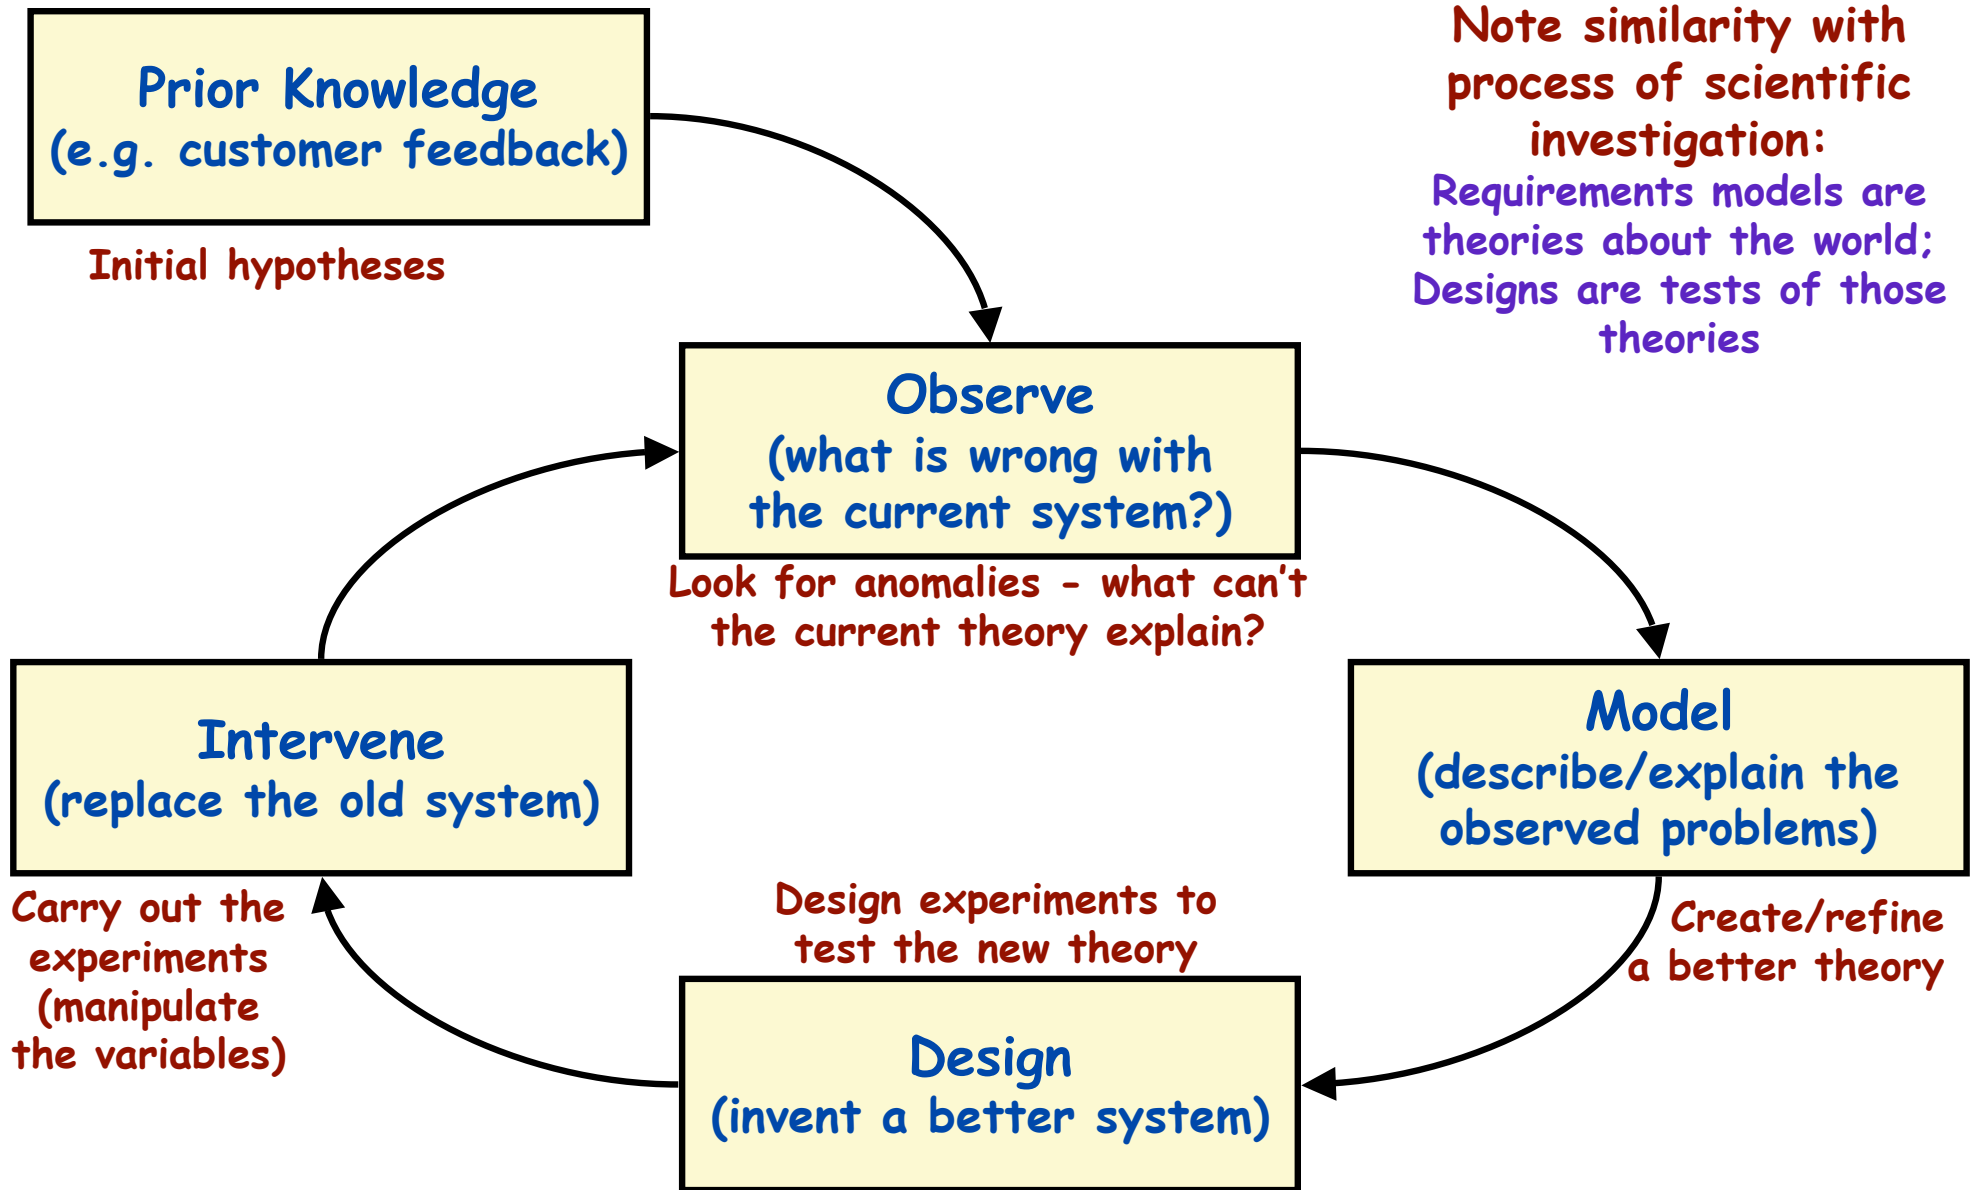

- ↪ Does the flight software,  $P$ , running on the aircraft flight computer,  $C$ , correctly implement  $S$ ?
- ↪ Does  $S$ , in the context of assumptions  $D$ , satisfy  $R$ ?

## → Validation

- ↪ Are our assumptions,  $D$ , about the domain correct? Did we miss any?
- ↪ Are the requirements,  $R$ , what is really needed? Did we miss any?

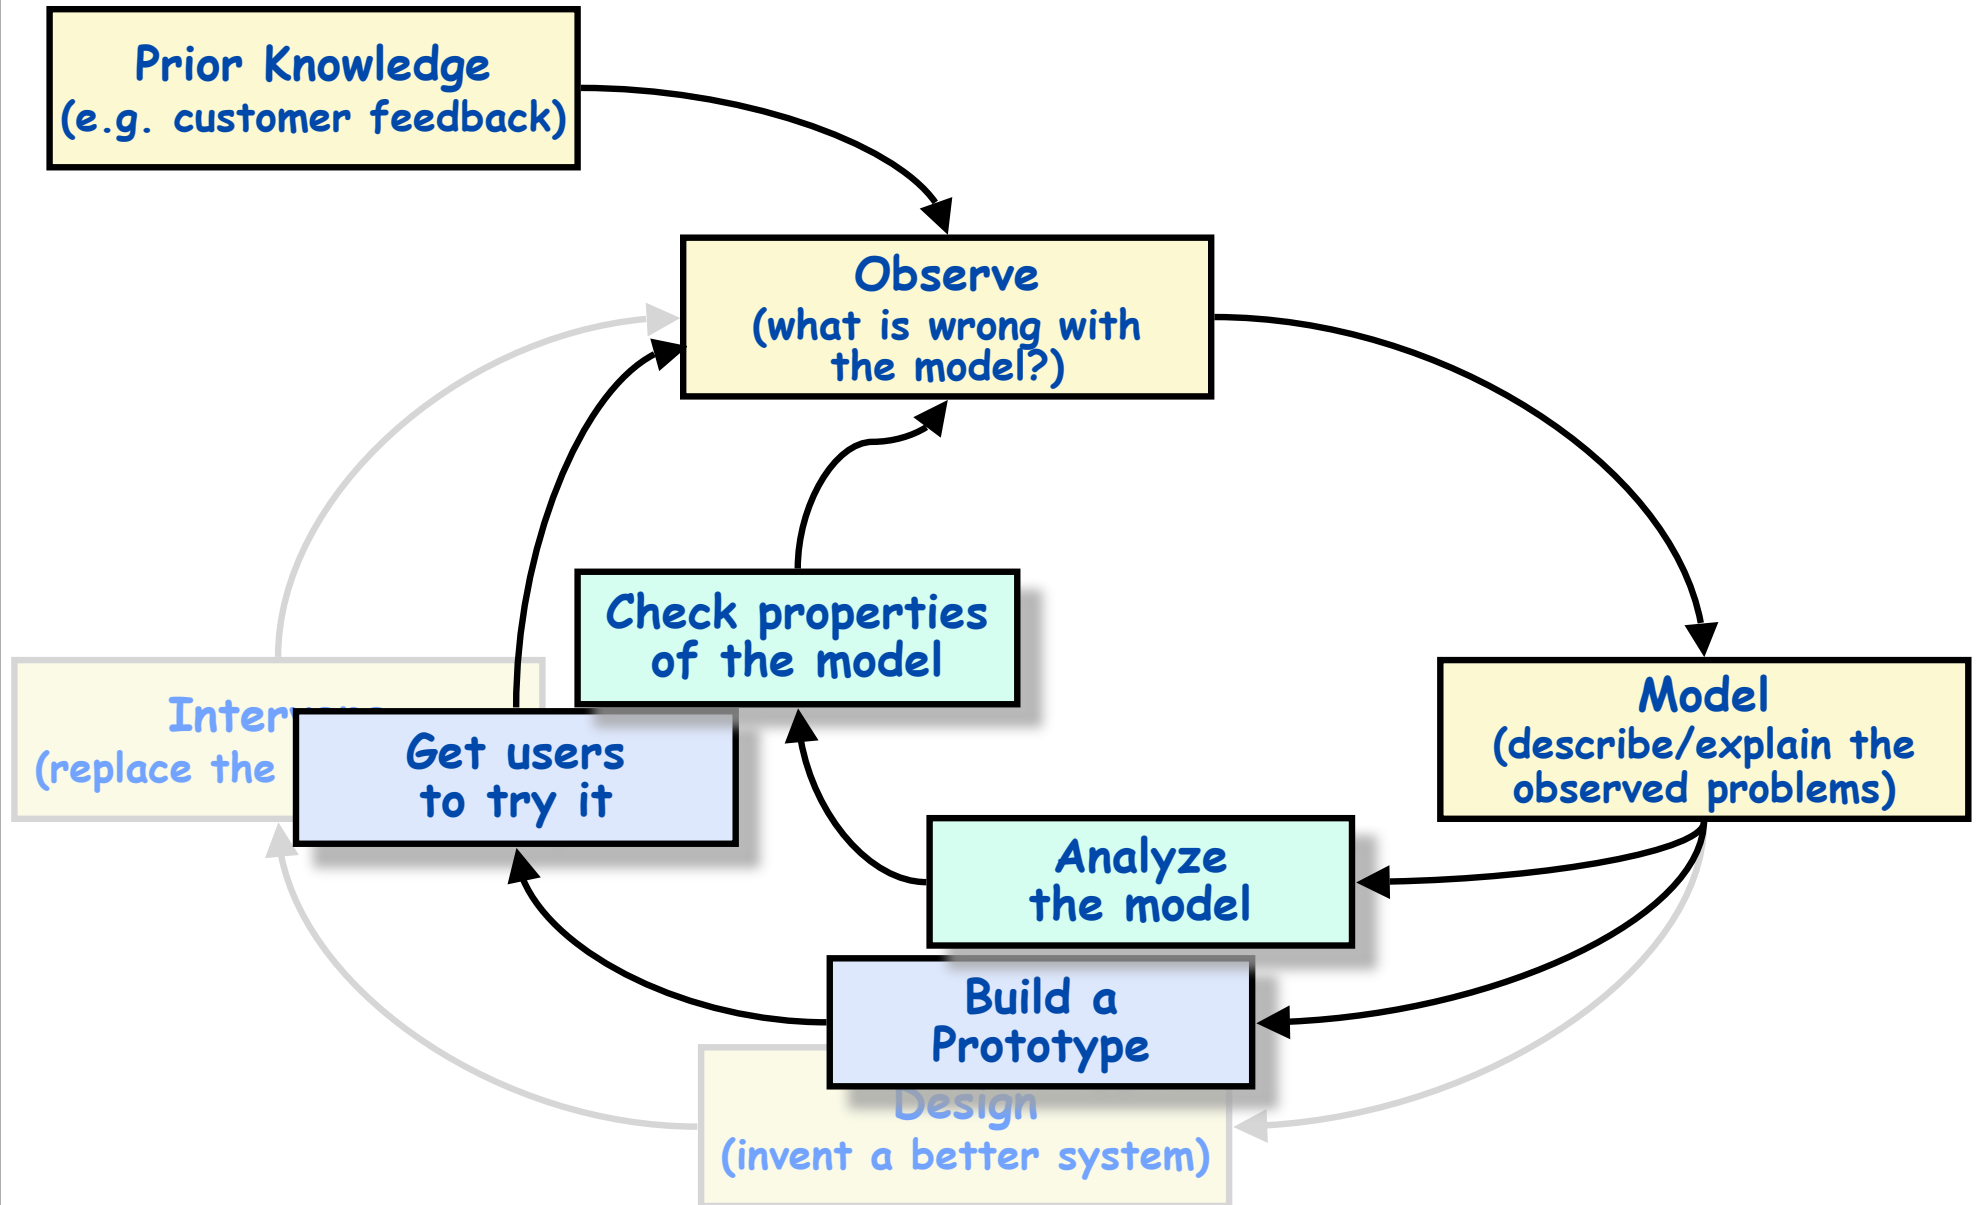

# Inquiry Cycle

# Shortcuts in the inquiry cycle

# Prototyping

“A software prototype is a partial implementation constructed primarily to enable customers, users, or developers to learn more about a problem or its solution.” [Davis 1990]

“Prototyping is the process of building a working model of the system” [Agresti 1986]

## → Approaches to prototyping

### ↳ Presentation Prototypes

- used for **proof of concept**; explaining design features; etc.
- explain, demonstrate and inform - then throw away

### ↳ Exploratory Prototypes

- used to **determine problems**, elicit needs, clarify goals, compare design options
- informal, unstructured and thrown away.

### ↳ Breadboards or Experimental Prototypes

- explore **technical feasibility**; test suitability of a technology
- Typically no user/customer involvement

### ↳ Evolutionary (e.g. “operational prototypes”, “pilot systems”):

- development seen as continuous process of adapting the system
- “prototype” is an early deliverable, to be continually improved.

# Throwaway or Evolve?

## → Throwaway Prototyping

### ↳ Purpose:

- to learn more about the problem or its solution...
- discard after desired knowledge is gained.

### ↳ Use:

- early or late

### ↳ Approach:

- horizontal - build only one layer (e.g. UI)
- "quick and dirty"

### ↳ Advantages:

- Learning medium for better convergence
- Early delivery → early testing → less cost
- Successful even if it fails!

### ↳ Disadvantages:

- Wasted effort if reqts change rapidly
- Often replaces proper documentation of the requirements
- May set customers' expectations too high
- Can get developed into final product

## → Evolutionary Prototyping

### ↳ Purpose

- to learn more about the problem or its solution...
- ...and reduce risk by building parts early

### ↳ Use:

- incremental; evolutionary

### ↳ Approach:

- vertical - partial impl. of all layers;
- designed to be extended/adapted

### ↳ Advantages:

- Requirements not frozen
- Return to last increment if error is found
- Flexible(?)

### ↳ Disadvantages:

- Can end up with complex, unstructured system which is hard to maintain
- early architectural choice may be poor
- Optimal solutions not guaranteed
- Lacks control and direction

**Brooks: "Plan to throw one away - you will anyway!"**

# Model Analysis

## → Verification

- ↪ “Is the model well-formed?”
- ↪ Are the parts of the model consistent with one another?

## → Validation:

- ↪ Animation of the model on small examples
- ↪ Formal challenges:
  - “if the model is correct then the following property should hold...”
- ↪ ‘What if’ questions:
  - reasoning about the consequences of particular requirements;
  - reasoning about the effect of possible changes
  - “will the system ever do the following...”
- ↪ State exploration
  - E.g. use model checking to find traces that satisfy some property

# Basic Cross-Checks for UML

## Use Case Diagrams

- ↪ Does each use case have a user?
  - Does each user have at least one use case?
- ↪ Is each use case documented?
  - Using sequence diagrams or equivalent

## Class Diagrams

- ↪ Does the class diagram capture all the classes mentioned in other diagrams?
- ↪ Does every class have methods to get/set its attributes?

## Sequence Diagrams

- ↪ Is each class in the class diagram?
- ↪ Can each message be sent?
  - Is there an association connecting sender and receiver classes on the class diagram?
  - Is there a method call in the sending class for each sent message?
  - Is there a method call in the receiving class for each received message?

## StateChart Diagrams

- ↪ Does each statechart diagram capture (the states of) a single class?
  - Is that class in the class diagram?
- ↪ Does each transition have a trigger event?
  - Is it clear which object initiates each event?
  - Is each event listed as an operation for that object's class in the class diagram?
- ↪ Does each state represent a distinct combination of attribute values?
  - Is it clear which combination of attribute values?
  - Are all those attributes shown on the class diagram?
- ↪ Are there method calls in the class diagram for each transition?
  - ...a method call that will update attribute values for the new state?
  - ...method calls that will test any conditions on the transition?
  - ...method calls that will carry out any actions on the transition?

# Independent V&V

## → V&V performed by a separate contractor

- ↪ Independent V&V fulfills the need for an independent technical opinion.
- ↪ Cost between 5% and 15% of development costs
- ↪ Studies show up to fivefold return on investment:
  - Errors found earlier, cheaper to fix, cheaper to re-test
  - Clearer specifications
  - Developer more likely to use best practices

## → Three types of independence:

- ↪ **Managerial Independence:**
  - separate responsibility from that of developing the software
  - can decide when and where to focus the V&V effort
- ↪ **Financial Independence:**
  - Costed and funded separately
  - No risk of diverting resources when the going gets tough
- ↪ **Technical Independence:**
  - Different personnel, to avoid analyst bias
  - Use of different tools and techniques

# Summary

- **Validation** checks you are solving the right problem
  - ↳ Prototyping - gets customer feedback early
  - ↳ Inspection - domain experts read the spec carefully
  - ↳ Formal Analysis - mathematical analysis of your models
  - ↳ ...plus meetings & regular communication with stakeholders
- **Verification** checks your engineering steps are sound
  - ↳ Consistency checking - do the models agree with one another?
  - ↳ Traceability - do the design/code/test cases reflect the requirements?
- **Use appropriate V&V:**
  - ↳ Early customer feedback if your models are just sketches
  - ↳ Analysis and consistency checking if your models are specifications
  - ↳ Independence important if your system is safety-critical
